

Which of the former cities comprising the current New York City are most similar?

Daniel Costelloe

April 2019

(Continued from 1. Introduction)

2. Data

- a. As required by the assignment, FourSquare data was used. Using API calls, FourSquare data was obtained providing the categories for venues found within 500 meters of latitude and longitude for each neighborhood. These data were used for ranking the most common types of venues within a neighborhood.
- b. For each neighborhood, the neighborhood name and its corresponding latitude and longitude were obtained from a csv file which the instructor downloaded from https://geo.nyu.edu/catalog/nyu_2451_34572, which requests to be cited as <http://hdl.handle.net/2451/34572>. This is from the NYU Faculty Digital Archive, FDACommunities & Collections, Division of Libraries, Spatial Data Repository, 2014 New York City Neighborhood Names. The website provides this description of the data:
 1. Title: 2014 New York City Neighborhood Names
 2. Issue Date: 12-Apr-2016
 3. Description: This New York City Neighborhood Names point file was created as a guide to New York City's neighborhoods that appear on the web resource, "New York: A City of Neighborhoods." Best estimates of label centroids were established at a 1:1,000 scale, but are ideally viewed at a 1:50,000 scale.
 4. Publisher: New York (City). Department of City Planning
 5. Collection: Bytes of the Big Apple
- c. The python geolocator.geocode was used to obtain latitude and longitude coordinates for New York City and the Boroughs in general. This functionality is documented at <https://geopy.readthedocs.io/en/stable/>
